

CASE STUDY

Metropolitan Hotel Leeds

THE CLIENT

The Metropolitan Hotel in Leeds is part of the Principal Hayley collection of individual hotels across the UK and Europe. The hotel is close to all major transport links including M62, M621, M1 & Leeds Bradford International Airport and just minutes walk from Leeds train station.

The luxury 4* hotel boasts 120 bedrooms and can cater for business events, weddings and celebrations. The hotel has 18 event rooms that can hold up to 250 delegates.

THE CHALLENGE

The hotel recognises that its operations impact on the environment and are committed to continually improving working practices and implementing energy management technologies. One condition of any sustainable initiative is that it must reduce carbon footprint without negatively impacting on guest experience or comfort.

The Powerstar team were invited to conduct a site survey to analyse and present the guaranteed savings that the hotel would achieve from the installation of a Powerstar voltage optimisation system

THE SOLUTION

After a site evaluation and load analysis, it was identified that Powerstar could effectively optimise the incoming voltage to match the electrical profile of the site, resulting in quantifiable savings.

Due to its unique design Powerstar also provides total phase balancing and also filters harmonics from the supply.

The Powerstar system was installed with no disruption to the hotel operations and is providing savings 24/7 with no negative impact on guest experience.
